

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method in a data processing system for transferring data from a memory to a network adapter, the method comprising:
 - receiving a request to transfer data in the memory to a network adapter; [[and]]
 - setting a transfer size to align the data with a cache line size if the amount of data to be transferred is unequal to the cache line size, wherein an amount of data is less than or equal to the transfer size, and wherein the amount of data to be transferred is in a frame and has a frame size[.];
 - setting a valid length indicator, wherein the valid length indicator is set to the amount of data and wherein the network adapter outputs only the amount of data set by the valid length indicator after the data has been transferred to the network adapter; and
 - responsive to receiving the request, transferring to the network adapter an amount of data equal to the transfer size.
- 2-3. (Canceled).
4. (Original) The method of claim 1, wherein the cache line size is 2^n , wherein n is a positive integer.
5. (Original) The method of claim 1, wherein the data is transferred from the memory to the network adapter through a bridge chip.
6. (Currently Amended) A method in a data processing system for transferring data from a memory to a network adapter, the method comprising:
 - identifying frame size for a transfer of the data from the memory to the network adapter;
 - setting a length equal to a cache line size;
 - if the frame size is divisible by a cache line size without a remainder, setting a valid data length equal to the length field; [[and]]
 - if the frame size divided by the cache line size results in a remainder, setting the length field to align the data with the cache line size, wherein the length field is computed as
$$\text{length field} = (\text{FLOOR}(\text{frame size}/\text{CLS})+1)*\text{CLS},$$
wherein CLS is the cache length size[.]; and

initiating a transfer of the data from the memory to the network adapter using the valid data length and the length field, wherein the network adapter only outputs data identified by the valid data length.

7-8. (Canceled).

9. (Currently Amended) A means in a data processing system for transferring data from a memory to a network adapter, the data processing system comprising:

receiving means for receiving a request to transfer data in the memory to a network adapter; and

setting means for setting a transfer size to align the data with a cache line size if the amount of data to be transferred is unequal to the cache line size, wherein an amount of data is less than or equal to the transfer size, and wherein the amount of data to be transferred is in a frame and has a frame size[.];

second setting means for setting a valid length indicator, wherein the valid length indicator is set to the amount of data and wherein the network adapter outputs only the amount of data set by the valid length indicator after the data has been transferred to the network adapter; and

transferring means for, responsive to receiving the request, transferring to the network adapter an amount of data equal to the transfer size.

10-11. (Canceled).

12. (Original) The data processing system of claim 9, wherein the cache line size is 2^n , wherein n is a positive integer.

13. (Original) The data processing system of claim 9, wherein the data is transferred from the memory to the network adapter through a bridge chip.

14. (Currently Amended) A means in a data processing system for transferring data from a memory to a network adapter, the data processing system comprising:

identifying means for identifying frame size for a transfer of the data from the memory to the network adapter;

first setting means for setting a length equal to a cache line size;

second[.] setting means for setting a valid data length equal to the length field if the frame size is divisible by a cache line size without a remainder; [and]]

third[[.]] setting means for setting length field to align the data with the cache line size if the frame size divided by the cache line size results in a remainder, wherein the length field is computed as
length field = $(\text{FLOOR}(\text{frame size}/\text{CLS})+1)*\text{CLS}$,
wherein CLS is the cache length size[[.]]; and
initiating means for initiating a transfer of the data from the memory to the network adapter using the valid data length and the length field, wherein the network adapter only outputs data identified by the valid data length.

15-16. (Canceled).

17. (Currently Amended) A computer program product in a computer readable recordable medium for transferring data from a memory to a network adapter, the computer program product comprising:
first instructions for receiving a request to transfer data in the memory to a network adapter;
second instructions for setting a transfer size to align the data with a cache line size if the amount of data to be transferred is unequal to the cache line size, wherein an amount of data is less than or equal to the transfer size, and wherein the amount of data to be transferred is in a frame and has a frame size;
[[and]]
third instructions for setting a valid length indicator, wherein the valid length indicator is set to the amount of data and wherein the network adapter outputs only the amount of data set by the valid length indicator after the data has been transferred to the network adapter[[.]]; and
fourth instructions for, responsive to receiving the request, transferring to the network adapter an amount of data equal to the transfer size.

18. (Currently Amended) A computer program product in a computer readable recordable medium for transferring data from a memory to a network adapter, the computer program product comprising:
first instructions for identifying frame size for a transfer of the data from the memory to the network adapter;
second instructions for setting a length equal to a cache line size;
if the frame size is divisible by a cache line size without a remainder, setting a valid data length equal to the length field; [[and]]
if the frame size divided by the cache line size results in a remainder, setting the length field to align the data with the cache line size, wherein the length field is computed as
length field = $(\text{FLOOR}(\text{frame size}/\text{CLS})+1)*\text{CLS}$,
wherein CLS is the cache length size; and

third instructions for initiating a transfer of the data from the memory to the network adapter using the valid data length and the length field, wherein the network adapter only outputs data identified by the valid data length.

19. (Currently Amended) A server data processing system for obtaining cultural context information from a client, the server data processing system comprising:

a bus system;

a network adapter connected to the bus system;

a memory connected to the bus system, wherein the memory includes a set of instructions; and

a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to receive a request to transfer data in the memory to the network adapter and set the transfer size to align the data with the cache line size if the amount of data to be transferred is unequal to the cache line size, wherein the amount of data is less than or equal to the transfer size, wherein the amount of data to be transferred is in a frame and has a frame size, [[and]] wherein a valid length indicator is set to the amount of data and wherein the network adapter outputs only the amount of data set by the valid length indicator after the data has been transferred to the network adapter[.], and responsive to receiving the request, an amount of data equal to the transfer size is transferred to the network adapter.

20. (Currently Amended) A server data processing system for obtaining cultural context information from a client, the server data processing system comprising:

a bus system;

a network adapter connected to the bus system;

a memory connected to the bus system, wherein the memory includes a set of instructions; and

a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to identify the frame size for a transfer of the data from the memory to the network adapter[;], set the length equal to a cache line size[;], set the valid data length equal to the length field if the frame size is divisible by a cache line size without a remainder[;], and set the length field to align the data with the cache line size if the frame size divided by the cache line size results in a remainder, wherein the length field is computed as

length field = (FLOOR(frame size/CLS)+1)*CLS,

wherein CLS is the cache length size[;], and

~~third instructions for initiating~~ initiate a transfer of the data from the memory to the network adapter using the valid data length and the length field, wherein the network adapter only outputs data identified by the valid data length.
